

checkbox Guest WiFi Solutions

Spring Specials

HSv530 Reg. \$1599.95

The CheckBox HSv530a is a powerful WiFi controller, designed for any location with high traffic and robust bandwidth needs.

Ideal for larger properties including motels, hotels, marinas, resorts, school campuses, apartment and condominium communities and any venue that needs maximum bandwidth for their guests and staff.

The HSv530a supports up to five high speed Internet connections and features automatic failover and load balancing providing more bandwidth and redundancy if one or more of your Internet connections fail.

The HSv530a also includes S/A/F/E - the Survey And Feedback Engine, and MultiNet - the unique feature that provides up to three separate WiFi networks with one controller and one set of access points.

With MultiNet your CheckBox can provide separate multiple networks without any additional hardware. Multinet allows your CheckBox system to provide two separate guest networks and one encrypted management network with just one CheckBox controller and one set of CheckBox access points.

With S/A/F/E - the Survey And Feedback Engine, after your guests log on you can automatically send them a welcome text or email. During their visit they can reply to that text or email to communicate with your organization in real time, and after they leave the system can send an automatic follow up message and an optional survey. With S/A/F/E your CheckBox does more than connect your guests to the Internet - it connects them to you!

Today the battlefield in WiFi is all about density - the often overwhelming concentration of WiFi capable devices in a given area. Modern access points have to be able to handle high numbers of devices and the noise they will generate. CheckBox access points have the processing power, advanced software and multiple radios to handle the ever expanding collection of WiFi devices your guests and customers carry.

CheckBox AX3 dual radio/dual band Meshing Access Points are designed to work with CheckBox controllers providing integrated and unified control of your system. All system parameters are set from the administrative screens of your CheckBox controller; no need to log into individual access points to set IP addresses, channels, SSIDs and meshing modes. Set parameters from one screen and all changes propagate automatically to all of the nodes in your system.

CheckBox Meshing Access Points operate in wired or wireless modes, allowing you to expand your network without running additional cabling, and are available in outdoor and indoor configurations utilizing Power-over-Ethernet to simplify wiring.
